5. Conclusions

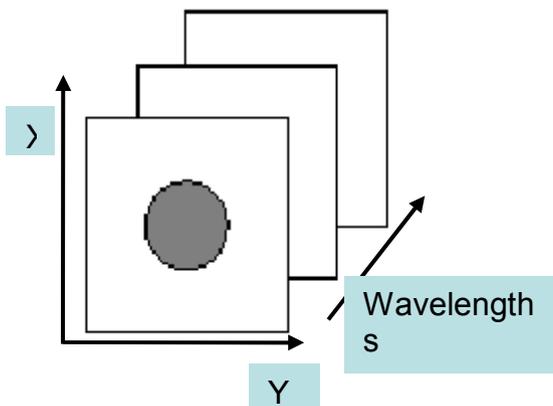

Introduction

Aim: Study the dynamics of the solar corona at minimum of activity using LASCOC1 spectral data.

Data Used

<i>Date</i>	<i>Xsize (pixels)</i>	<i>Ysize (pixels)</i>	<i>bin</i>	<i>Exp. time (s)</i>	$\lambda_{on\ min}$ (\AA)	$\lambda_{on\ max}$ (\AA)	λ_{off} (\AA)	$\lambda-$ step (\AA)
Aug - Oct 1996	832	672	1	25	5300.90	5303.95	5309.24	0.3
Aug - Oct 1996	832	672	1	16	6374.11	6377.94	6380.95	0.5

Each on-line image:
 emission corona + continuum corona +
 stray light

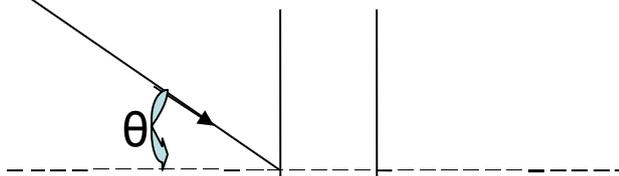

Magurele 2007

Data Reduction

- normalize by exposure time
- bias correction
- cosmic rays removal

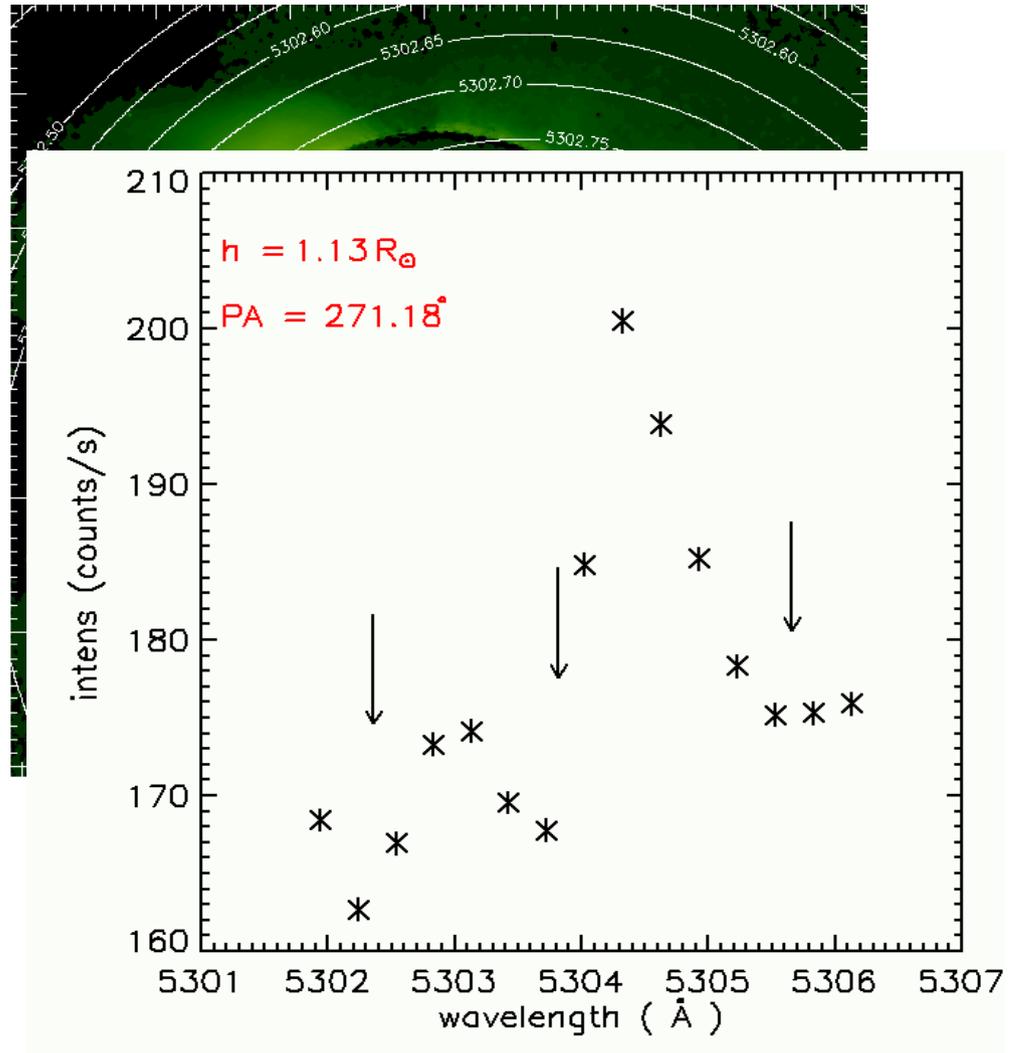

Correction of FP transmittance

Fe XIV: Calibration of wavelengths
using the main absorption line

Fe X: Exposure time correction

$$n \cdot d \cdot \cos\theta = m \cdot \lambda / 2$$

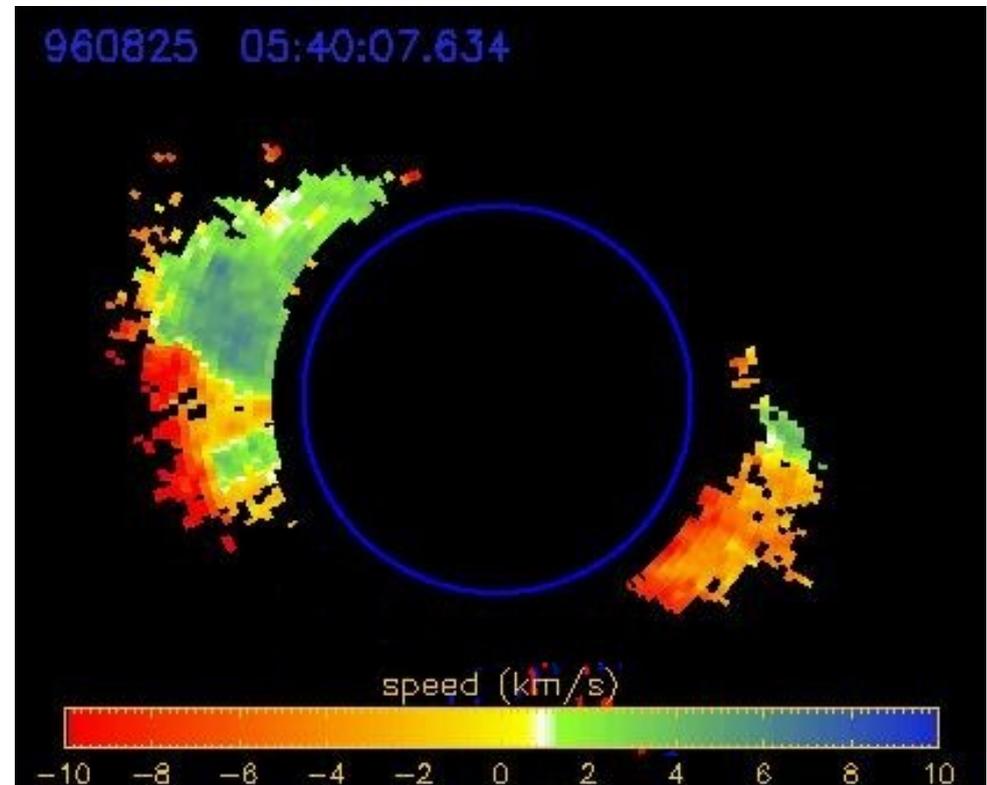

Determination of LOS Velocities

from the position of the emission line peak with respect to the reference line peak (average over the whole corona)

=> LOS velocities

(0.1 Å ~ 5.6 km/s)

(0.1 Å ~ 4.7 km/s)

4

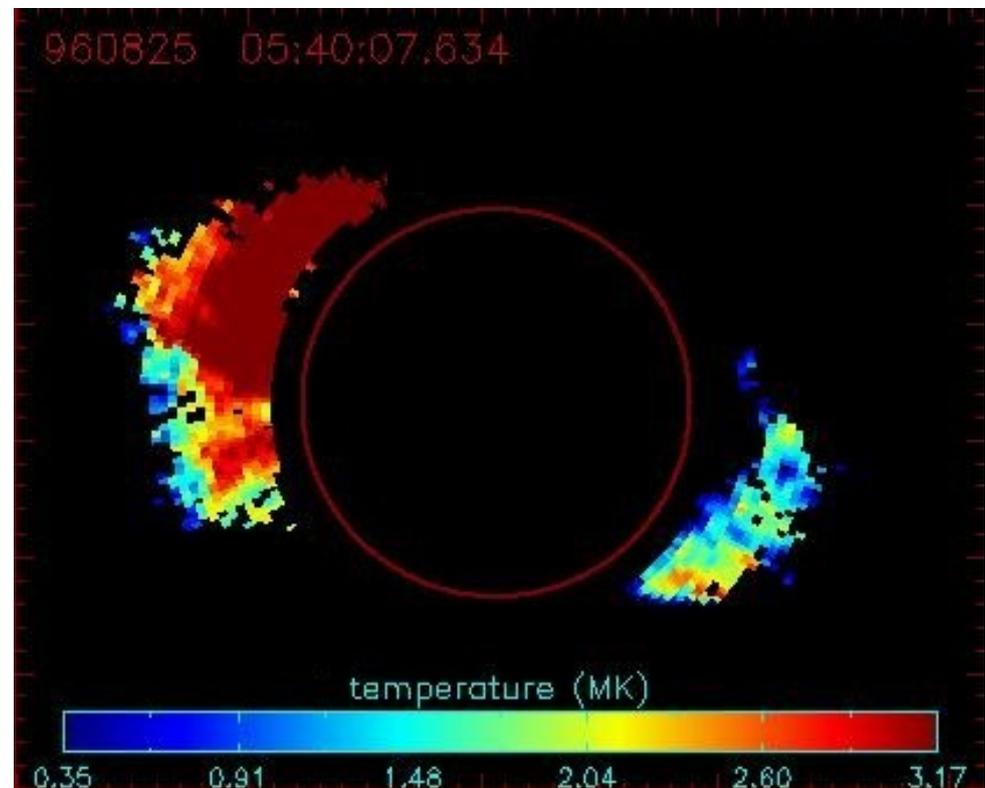

Determination of Effective Temperatures

from the line width value, after
correcting for the instrumental
profile

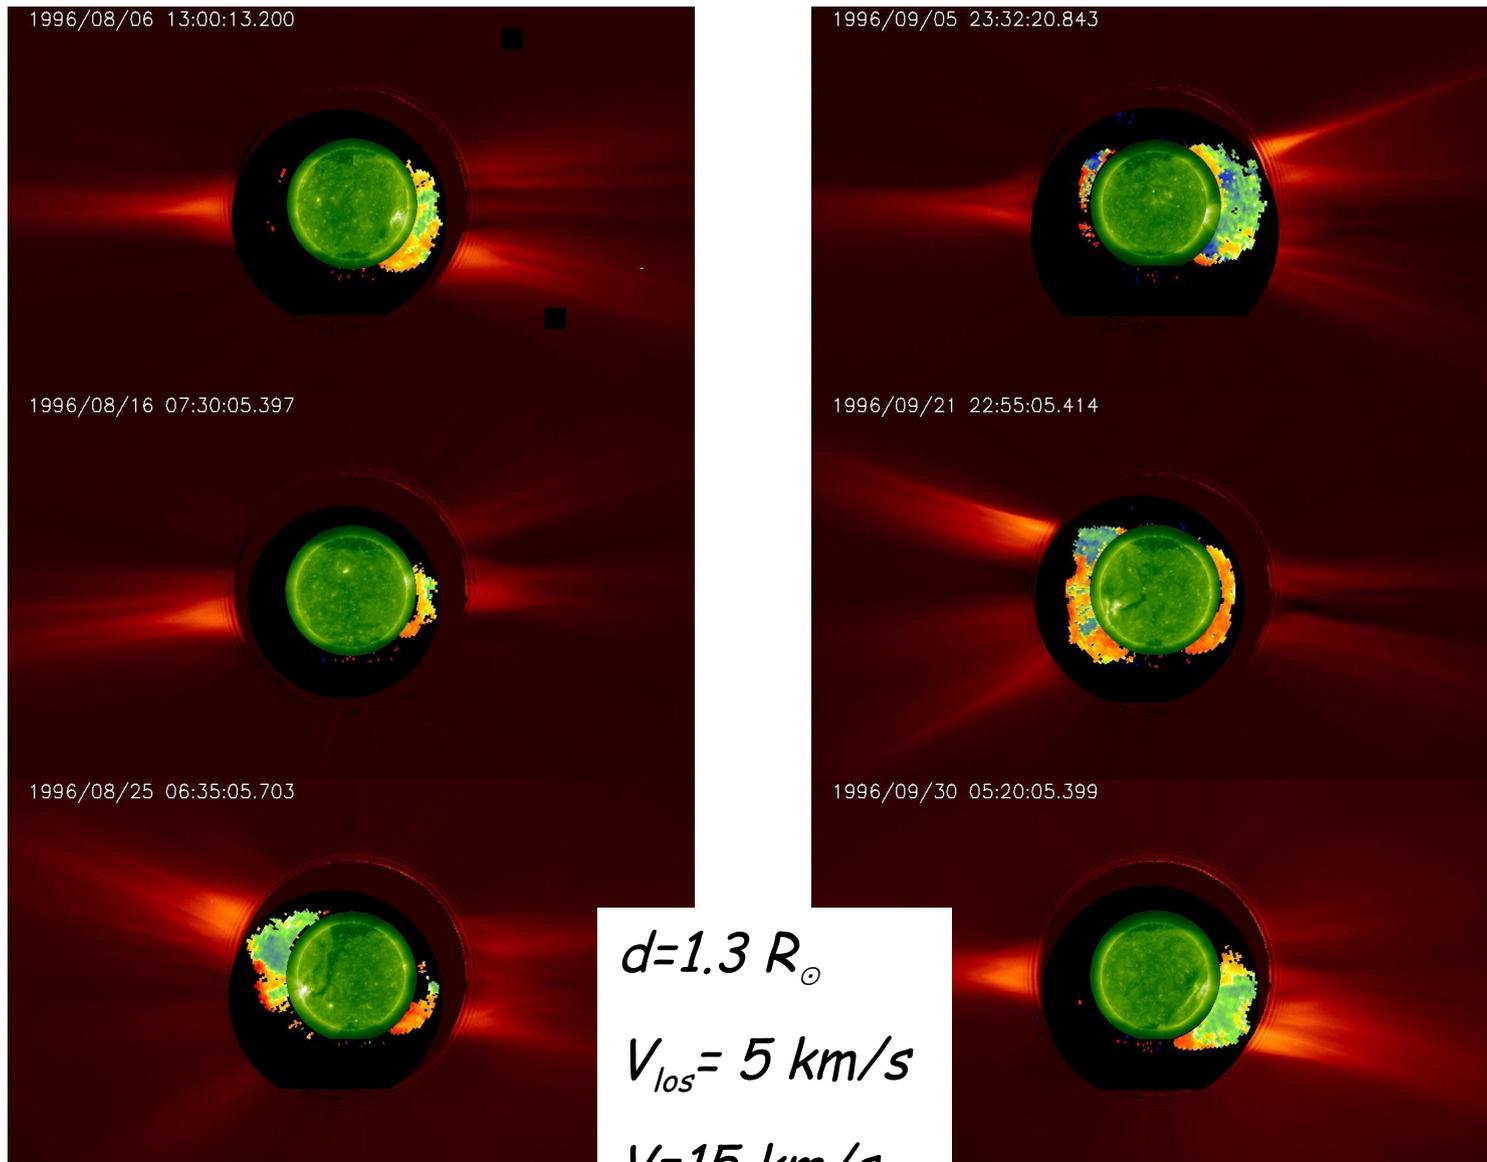

=> effective temperatures

(0.7 Å ~ 2MK)

(0.6 Å ~ 1MK)

Slow Solar Wind

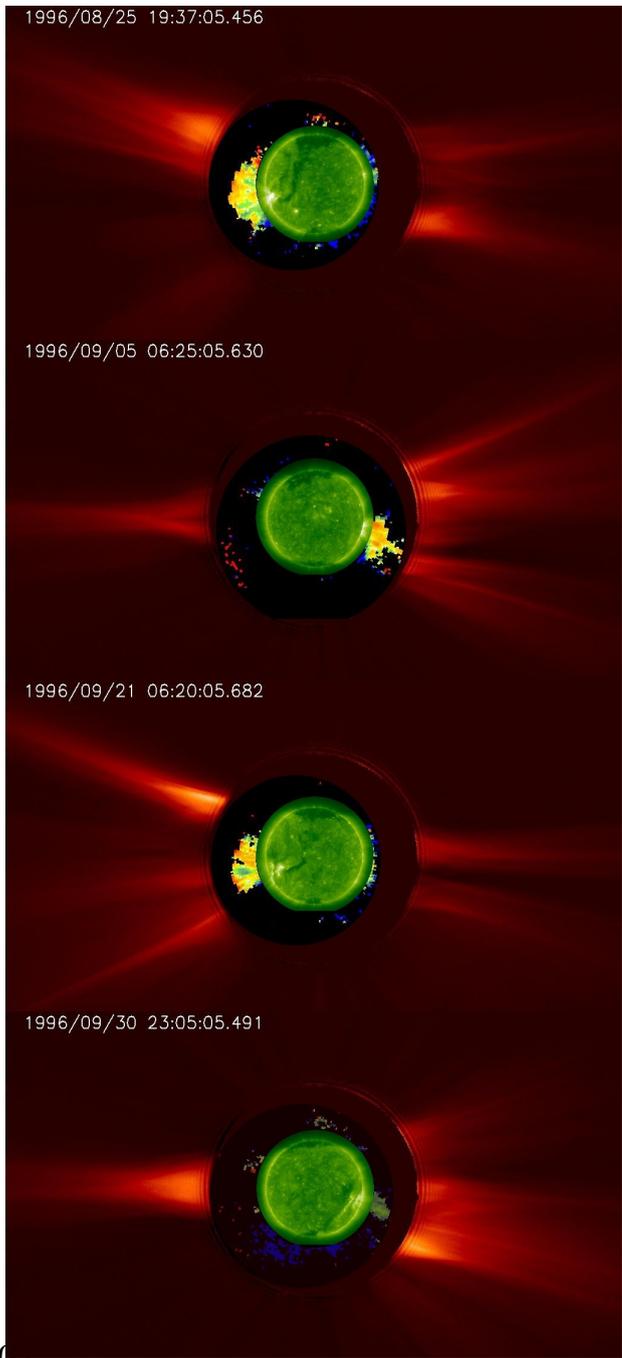

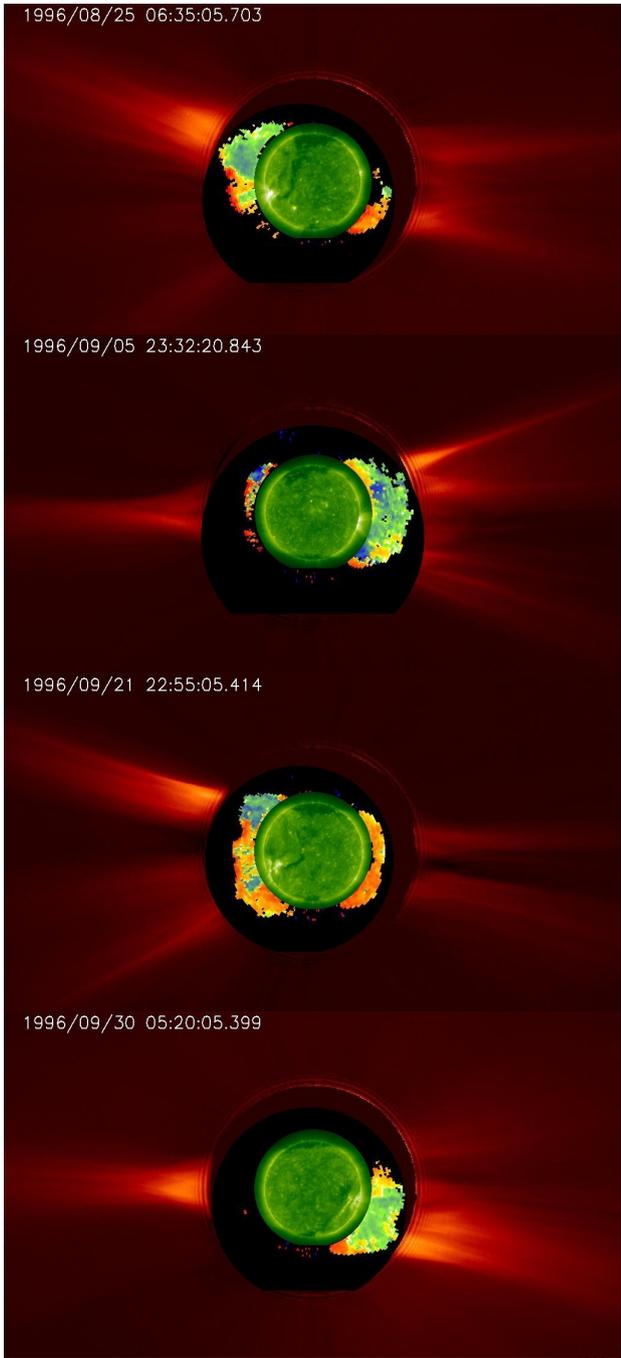

$d=1.3 R_{\odot}$

$V_{los} = 5 \text{ km/s}$

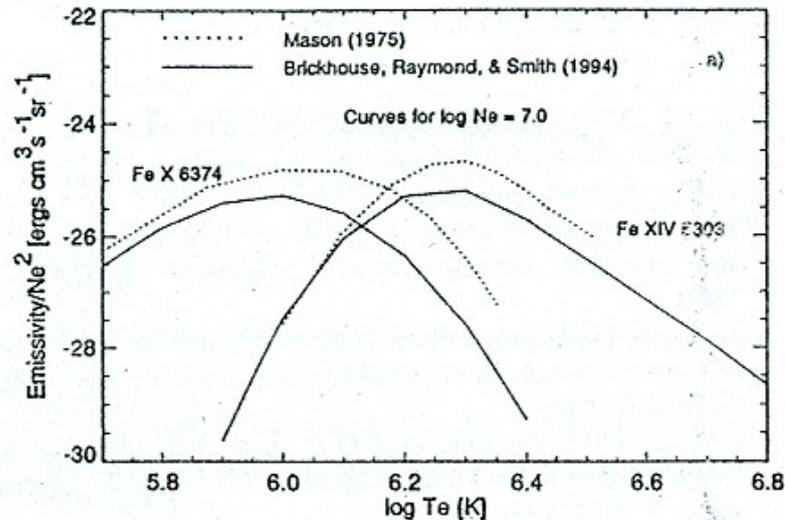

$V = 15 \text{ km/s}$

Magurele 2007

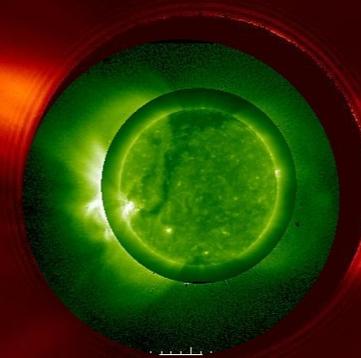

Streamers

1996/0

08/25 06:35:05.703

Streamers: $T_e \sim 1.35$ MK at $1.03 R_\odot$ (Feldman et al. 1998 - *SUMER*)

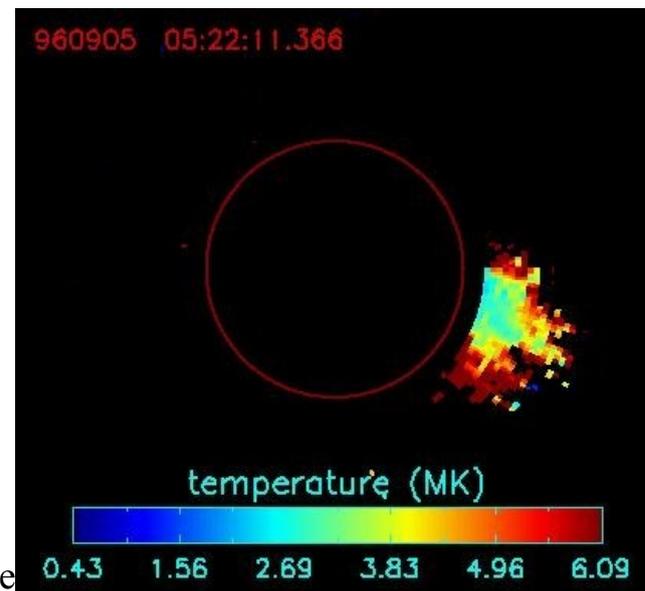

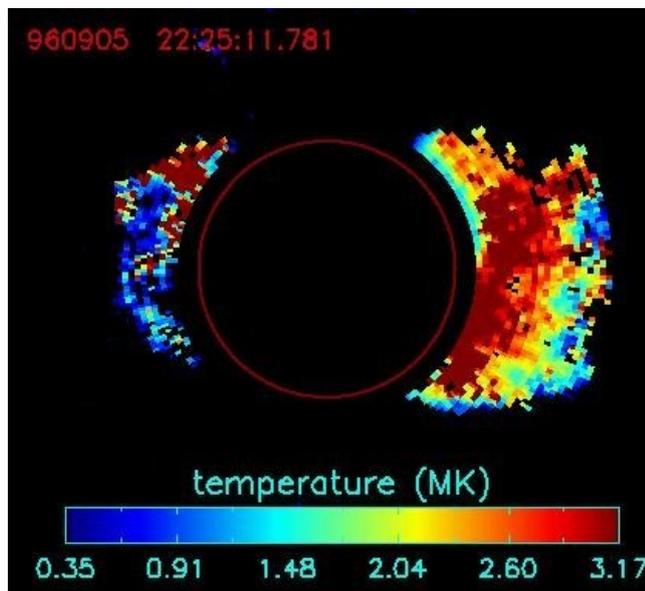

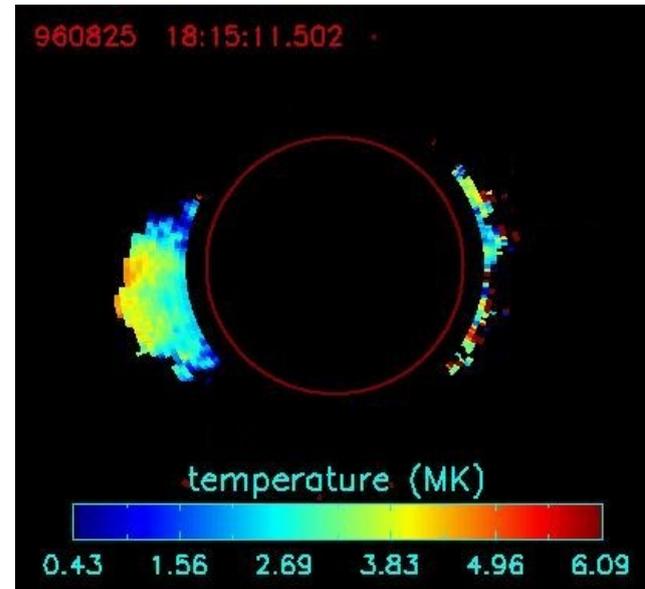

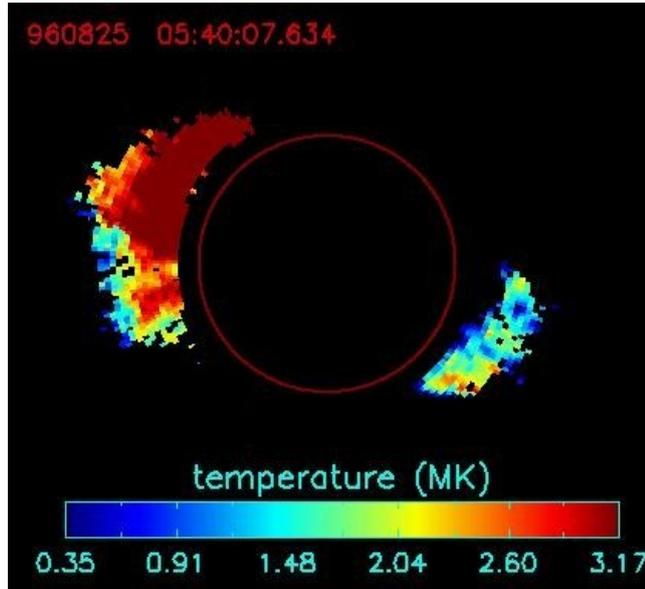

$T_e \sim 1.8$ MK at $1.15 R_\odot$ (Li et al. 1998 - *Yohkoh SXT*)

$T_e \sim 1.4$ MK at $1.4 R_\odot$ (Gibson et al. 1999, Parenti et al. 2000 - *CDS*)

$T_e \sim 1.6$ MK at $1.5 R_\odot$ (Raymond et al. 1997 - *UVCS*)

$T_e \sim 1.6 - 2.0$ MK at $1.1 - 2.0 R_\odot$ (Ichimoto et al. 1996 - *model*)

Effective Temperatures

rele

Effective Temperatures

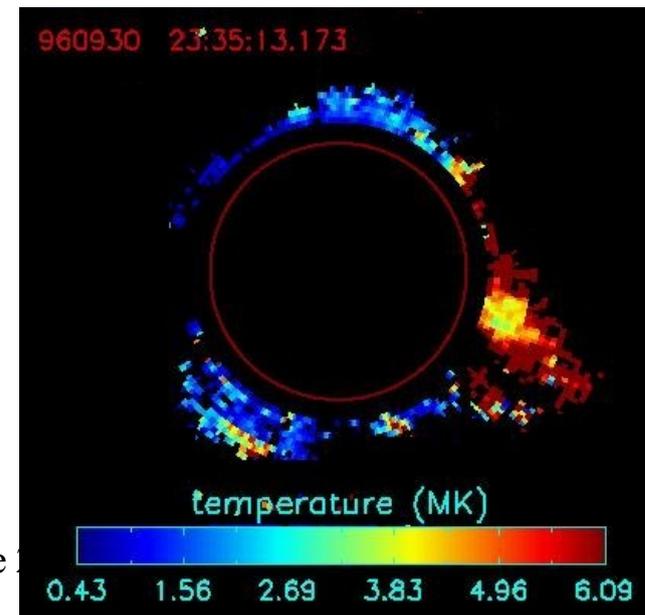

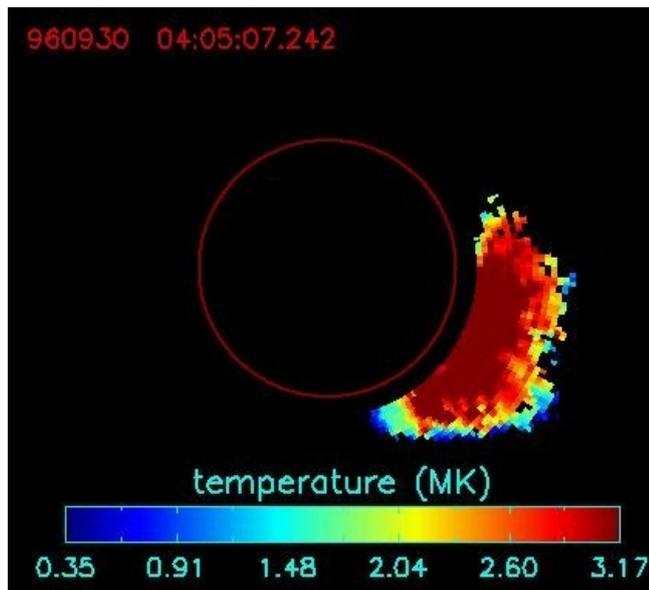

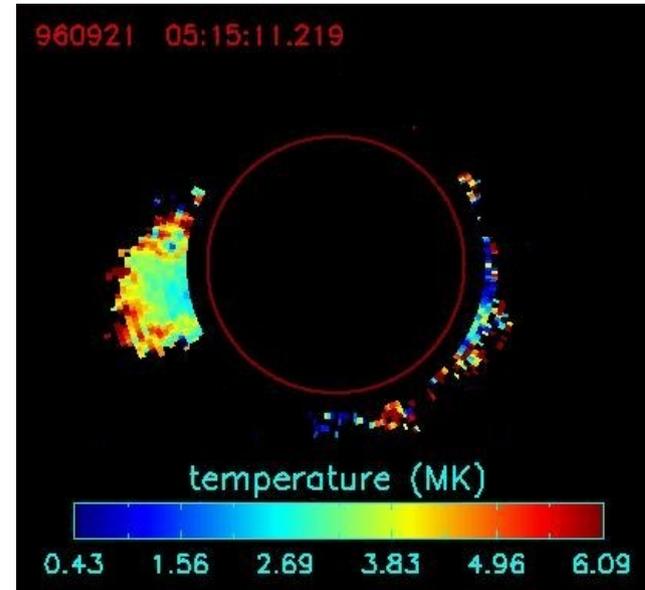

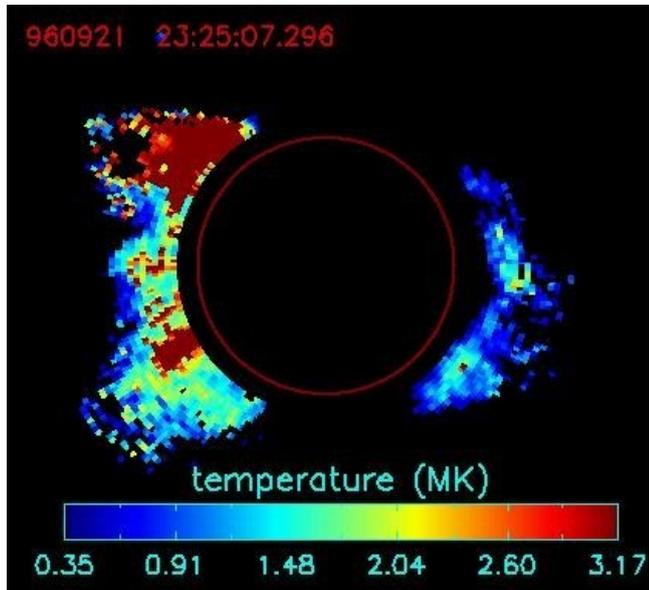

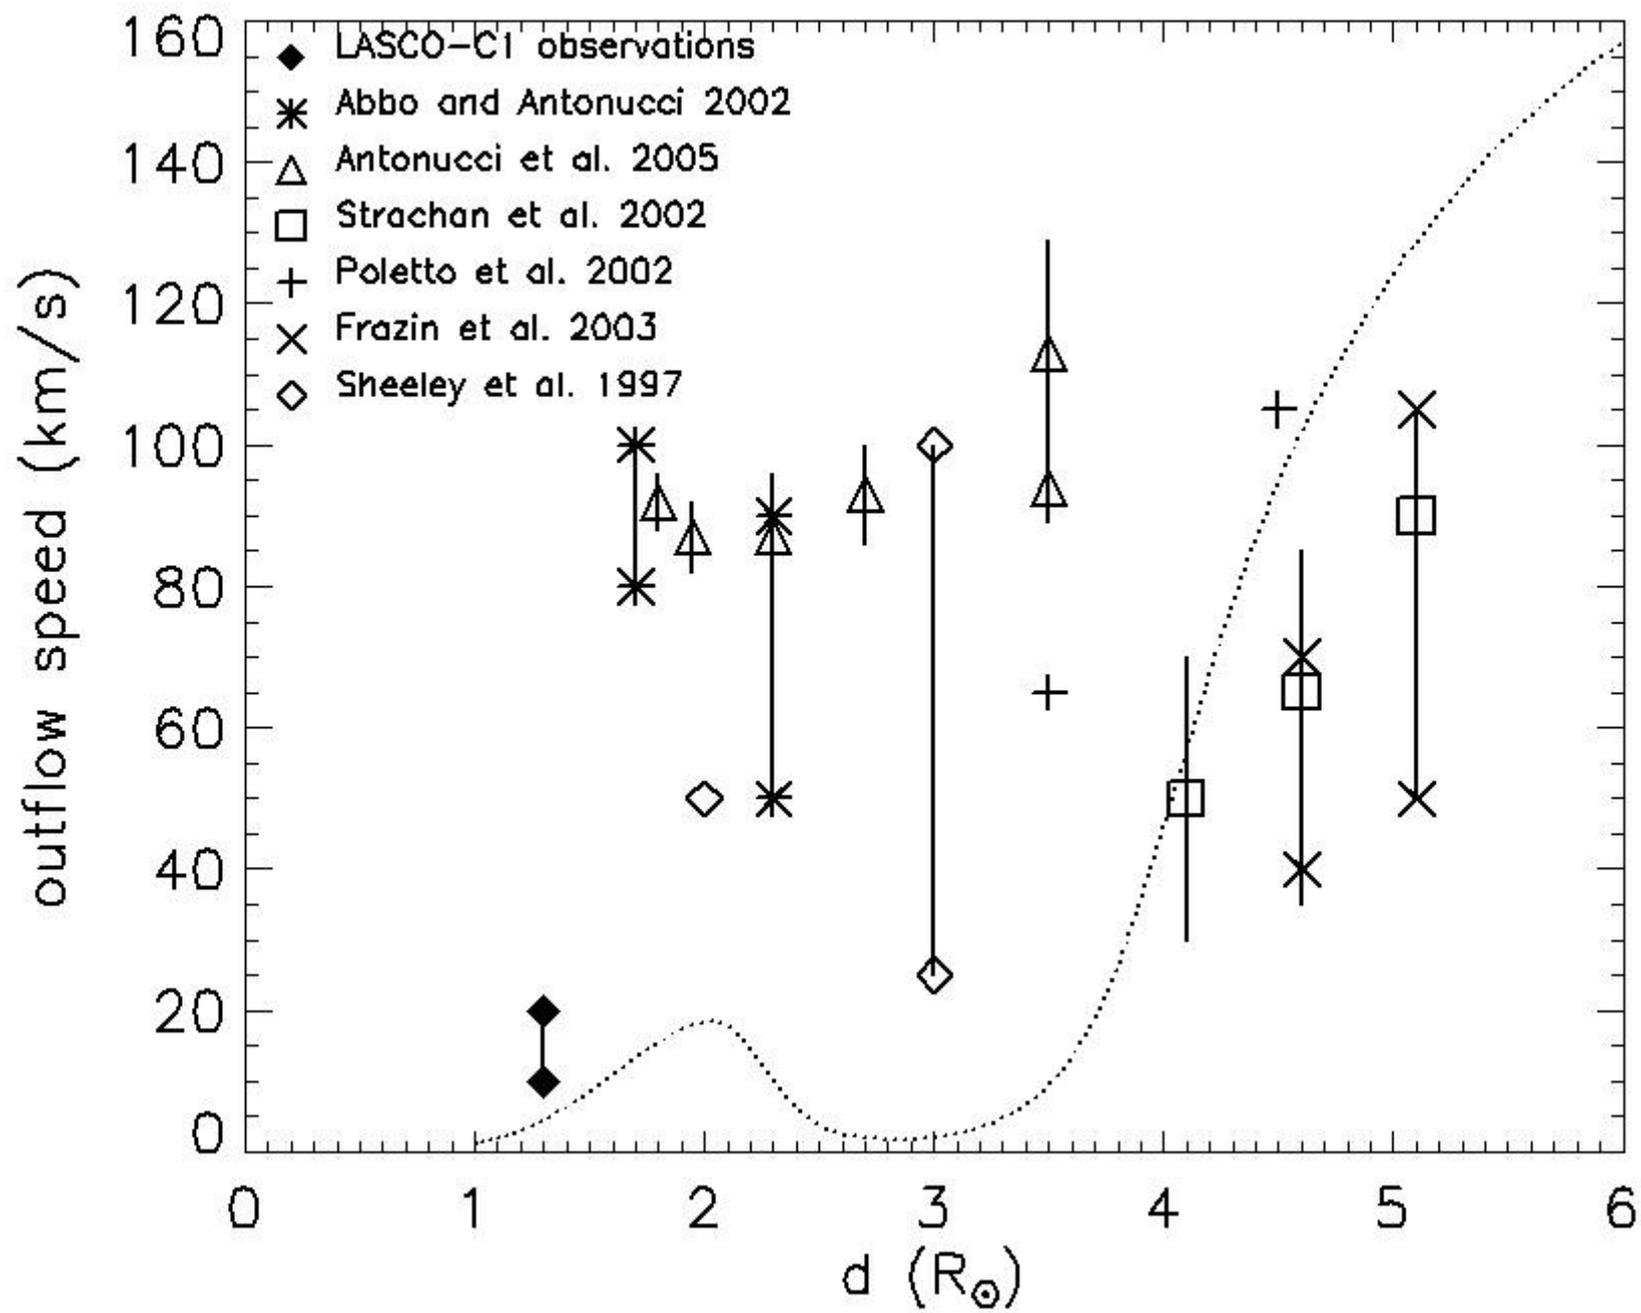

Figure 1

Conclusions (2)

Fe X emission is associated with cooler closed loops

Fe XIV emission is associated with the hotter plasma at the base of the streamers
